III. FORMULA INDEX

KEY

In using this index the following should be borne in mind

1 The Formula Index is supplementary to the Subject Index, in no sense does it replace any part of the latter. Unnamed, incompletely described compounds can often be given specific entry in the Formula Index only

2 Inorganic as well as organic compounds have been entered

3 Entries under their own formulas are made for all strictly inorganic and strictly organic compounds and for the true organic derivatives of organic compounds, both addition compounds and true reaction derivatives (this includes esters, hydrazones, methohalides, oximes, picrates, semicarbazones, etc). Inorganic salts of organic acids and inorganic addition compounds of organic compounds (hydrohalides, chloroplatinate, perchlorates, sulfates, etc) are not given separate entries but are indicated in modifying phrases under the formulas of the compounds from which they are derived (under the acid in the case of a salt). Salts of formic, acetic and oxalic acids are exceptions, these are entered as such

4. The arrangement of symbols in formulas is alphabetical except that in carbon compounds C always comes first, followed immediately by H if hydrogen is also present

5 The arrangement of formulas is also alphabetical except that the number of atoms of any specific kind influences the order of compounds e g, all formulas with 1 C come before those with C₂, thus CCl₂O, CCl₄, CHCl₃, CHN, CHNO, CH₂Br₂, CH₂O, CH₂Cl, CO, C₂Ca, C₂H₂O₂

6 The arrangement of entries under any heading is strictly alphabetical according to the preferred names of the isomers

7. Entries consist of (a) the formula (in bold-face type), (b) the name as it has been entered in the Subject Index (in light-face Roman type; it should be noted particularly that the part of the entry in this type is the exact equivalent of the formula given), (c) occasionally a modifying phrase or word such as "Ca salt" or "hydrochloride" (in italics, different type being used to set off that part of a compound being indexed which is not represented in the formula used, see ¶ 3 above), (d) the page reference and (e) the fraction of the page in months (indicated by a small superior numeral) in which the compound will be found

8 Cross-references are to the Subject Index

9 Water of hydration is not made a part of the formulas indexed but is usually given in light-face type following the formulas

10 Polymers having different names and recognized as different substances, e g, acetaldehyde and paraldehyde, are all entered under their accepted formulas. But definite compounds for which different polymeric formulas are in use are entered under the simplest formula only with cross references under the polymeric formulas

11 A straight line, thus —, used under some headings to avoid repetition of names, always stands for the name of the 'index compound,' i e, that part of the preceding name (inverted) which comes before the comma

12 'P' before a page number indicates that the abstract is of a patent.

13 The names beryllium (Be), columbium (Cb), hafnium (Hf) and illium (Il) are given preference over glucinum (Gl), niobium (Nb), celcium (Ct) and florentium (Fr), respectively, for these elements

The Key to a formula index is necessarily lengthy. It would not be correct to conclude from this that this index is difficult to use. Experience is to the contrary.

INTRODUCTION

General purpose and policy The location of chemical compounds in an index by names is at times uncertain because names vary and in the case of complex compounds may be difficult to ascertain. New compounds are constantly being prepared, which, if named at all, may receive more than one name which is justified from one point of view or another and the possibilities of incorrect names are great. Since the kinds and number of component atoms of a chemical compound are unvarying characteristics the supplementary *Formula Index to Chemical Abstracts* is published for the purpose of eliminating this element of uncertainty in the Subject Index. Except that unnamed compounds are no longer entered under the heading 'Compound,' the Subject Index is in no way altered on account of the Formula Index. In the Subject Index related compounds are *grouped* rather effectively and to good use by the present system of indexing on the basis of 'parent compounds' or more accurately 'index compounds', in the Formula Index the certain location of *individual* compounds is the primary consideration. The Subject Index is more convenient to use in some respects and it frequently contains more information in the form of modifying phrases. The repetition of modifying phrases in the Formula Index beyond necessary brief phrases to indicate derivatives has been avoided as unnecessary for the accomplishment of the real purpose of this index, as stated above, and as inconsistent with necessary economy. Isomerism is not indicated in the Formula Index in cases in which the names differ only in position numbers or letters, but it always is in the Subject Index when known. Ready reference to the Subject Index for the purpose of locating information regarding related compounds is made possible by the use in the Formula Index of names following the formulas written exactly as they appear in the former index.

All new compounds and all compounds for which new data are given have been entered. Most of the compounds have been entered under their own formulas. Some departure from a policy of making separate formula entries for derivatives of all kinds is

reasonable and accords with custom. The only departures in this index (see ¶3 of the Key) have been in classes of compounds the natures of which would be more than likely apparent to the investigator. The interest in a salt of a complex organic acid, for example, is likely to be mainly in the acid and it is considered more valuable to have the record of it under the formula of the acid for the use of searchers looking up that acid.

In the case of unnamed organic compounds where possible the class, as acid, source and melting or boiling point have been given.

Cross-references to the Subject Index have been used for all simple inorganic compounds, for all minerals of definite composition and for the organic compounds more commonly met with, in general, whenever it seemed likely that users of *Chemical Abstracts* would predominately refer to the Subject Index.

The System. The system as described in the Key is with slight modifications that worked out by Dr Edwin A. Hill,¹ and used by the Classification Division of the U. S. Patent Office. This system is preferred to the system of *Richter's Lexikon* because of its greater simplicity and its applicability with equal fitness to inorganic as well as to organic compounds.
